

No proof. No payout.

DisburseGuard is a proof-paid treasury firewall for AI payout agents. The agent must buy, verify, sign, and ledger proof before company money can move.

\$0.39

proof spend controls \$50K in capital exposure

PROOF OBJECTS

x402-style proof gates

Gemini extraction

Vultr Postgres ledger

AI agents are crossing from advice into authorization.

Summaries are not proof. A payout agent needs a pre-payout enforcement layer, not another dashboard after the money is gone.

\$75K

sample payout request held before release

PROOF OBJECTS

Risk appears before audit

Human queues do not scale

Treasury needs machine-verifiable clearance

Evidence is protected by payment, not trust.

Proof endpoints return HTTP 402 until the agent pays. Only paid receipts can enter the treasury policy decision.

402

payment required before proof access

PROOF OBJECTS

vendor-risk

recipient-match

sanctions-screen

delivery-attestation

The product is an acting agent, not a passive dashboard.

Intake Agent extracts context, Proof Agent creates the plan, Payment Agent buys receipts, Policy Guard decides, and Audit Agent signs the packet.

5

agents in one clearance loop

PROOF OBJECTS

- Payout intent
- Proof plan
- Paid receipts
- Policy outcome
- Signed packet

Proof quality directly controls how much capital can move.

In the live scenario, DisburseGuard limits a \$75,000 payout to \$25,000 and keeps \$50,000 controlled until better proof arrives.

\$25K

authorized from a \$75K request

PROOF OBJECTS

CLEAR: verified release

LIMIT: capped payout

REVIEW: human queue

BLOCK: hard stop

Every clearance becomes independently verifiable.

The ClearancePacket contains proof hashes, policy version, expiry, rationale, public key, and signature. The ledger chains every event hash.

valid

packet signature and event chain

PROOF OBJECTS

production-key signature

append-only event hashes

/api/clearance/:id/verify

A protocol-shaped product for autonomous finance.

DisburseGuard aligns directly with x402 payments, Gemini, Vultr, B2B FinOps, compliance, and agentic workflows.

live

public Vultr deployment

PROOF OBJECTS

x402: paid proof primitive

Gemini: extraction agent

Vultr: deployed ledger

FinOps: payout control
