

DISBURSEGUARD

Proof-Paid Treasury Firewall

No proof, no payout. AI payout agents must buy, verify, sign, and ledger proof before company money can move.

x402-style paid proof gates

Gemini extraction

Vultr-backed ledger

PROBLEM

Autonomous agents can move faster than treasury controls

AI agents can parse invoices and trigger workflows, but most financial controls still rely on after-the-fact dashboards or human review queues.

Risk appears before audit

Summaries are not proof

Payment authorization needs an enforceable pre-payout gate

SOLUTION

Turn proof into a paid prerequisite

The agent must request protected evidence endpoints, receive HTTP 402 payment metadata, buy proof receipts, and only then ask Policy Guard to decide.

Vendor-risk proof

Recipient-match proof

Sanctions-screen proof

Delivery-attestation proof

Every payout becomes a verifiable clearance run

Payout intent -> Gemini extraction -> proof plan -> x402 proof gate -> paid receipts -> policy decision -> signed ClearancePacket -> ledger verification.

Agent acts, not just displays

Proof spend can stop after hard-risk signal

Receipts are hash-linked into the decision

LIVE DEMO RESULT

\$0.39 of proof controls \$50,000 of capital exposure

In the high-value scenario, DisburseGuard caps a \$75,000 request to \$25,000, signs the packet with a production key, and verifies the event chain.

Requested: USD 75,000

Authorized: USD 25,000

Ledger: postgres-drizzle valid chain

WHY IT WINS

A protocol-shaped product, not another dashboard

DisburseGuard creates an economic enforcement loop for AI finance: spend cents on paid proof before releasing thousands in company funds.

Strong x402 fit

**B2B FinOps and compliance
use case**

**Public Vultr deployment with
verifiable APIs**
