

PROOF-PAID TREASURY FIREWALL

No proof.
No payout.

AI payout agents must buy evidence before company money can move.

REQUEST

\$75K

PROOF SPEND

\$0.39

CAPITAL CONTROLLED BEFORE PAYOUT

\$50K held before payout

Signed ClearancePacket + Vultr ledger

verify API

Gemini extraction + x402-style proof payments + deterministic policy + signed ledger verification

Dashboards explain risk after money already left.

Autonomous finance needs enforcement before payout, not a prettier audit view after the agent has acted.

AUDIT

too late

Agent summaries are not evidence

Human queues do not scale

Treasury needs machine-verifiable proof

Evidence is a paid gate, not a trusted checkbox.

Protected proof endpoints deny access with HTTP 402. The Payment Agent must create receipts before evidence can influence the treasury decision.

The demo acts through a full clearance chain.

Intake Agent, Proof Agent, Payment Agent, Policy Guard, and Audit Agent complete one verifiable payout loop instead of only displaying status.

\$0.39 of proof spend controls \$50K of exposure.

In the high-value reserve scenario, DisburseGuard limits a \$75,000 request to \$25,000 and keeps the remaining \$50,000 blocked until stronger proof arrives.

Every decision becomes a public verification object.

The ClearancePacket carries proof hashes, policy version, expiry, rationale, public key, and signature. The Vultr Postgres ledger chains every event hash.

/api/clearance/:id/verify

A payment primitive for agentic finance, not a generic dashboard.

DisburseGuard aligns the strongest hackathon surfaces: x402 paid proof gates, Gemini extraction, Vultr deployment, B2B FinOps, compliance, and a multi-step agent workflow.
